PRODUCT ONE-PAGER · PREPARED 26 OCTOBER 2026

Tetris 俄罗斯方块 — single-file browser game

A complete, dependency-free Tetris implementation in one 34 KB HTML file. No build step, no server, no external assets, no network calls — runs offline in any modern browser.

Live demo: https://laurenthyz.github.io/test2510/ · **Source:** github.com/laurentHYZ/test2510

AT A GLANCE

Repository	**laurentHYZ/test2510 (public)**	Owner / maintainer	**laurentHYZ — sole collaborator (admin), sole contributor**
Created	**25 Oct 2026, 09:31 UTC**	Last commit	**26 Oct 2026, 10:49 UTC (e0d8bab)**
Commits / contributors	**5 commits, 1 contributor**	Branch / releases	**main · 0 releases, 0 tags**
Repo contents	**index.html (34,069 B), README.md, screenshot.png**	Primary language	**HTML (100% of code)**
Live hosting	**GitHub Pages, build status “built”, HTTPS enforced**	Custom domain	**none (github.io path only)**
License	**None — no LICENSE file; all rights reserved by default**	Stars / forks / watchers	**0 / 0 / 0**

WHAT THE PRODUCT IS

A single-page Tetris game delivered as one self-contained HTML document. I inspected the live page directly: it loads one inline script (~27 KB) and one inline stylesheet, references no external scripts or fonts, and makes no network requests other than its own favicon. It is a fully offline-capable web app whose entire distribution is one file that can be opened from disk, e-mailed, or served from any static host.

TRACTION MEASURED TO DATE

8	1	0	25
PAGE VIEWS	UNIQUE VISITORS	STARS / FORKS	REPO CLONES*

Last-14-day totals from the GitHub traffic API. *12 unique cloners, which most likely reflects automation and mirroring rather than users; the demo has had one human visitor.

FEATURE SET

- 10×20 playfield, 7-bag randomiser
- Super Rotation System with full wall-kick tables
- Ghost piece, hold slot, 3-piece next preview
- Lock delay (500 ms, up to 15 resets)
- Guideline scoring: 100/300/500/800 × level, back-to-back and combo bonuses
- Level up every 10 lines, 15-step gravity curve
- Chiptune sound effects synthesised in-browser with the Web Audio API — no audio files
- Best score persisted in localStorage
- Bilingual UI (Simplified Chinese / English), Chinese default, choice remembered
- Responsive dark UI with on-screen touch controls

TECHNICAL HIGHLIGHTS

- **One file, no build step.** No bundler, no package manifest, no dependencies to patch or audit.
- **No supply chain.** Zero third-party code, zero external requests — nothing to compromise downstream.
- **Trivial distribution.** Any static host, any CDN, or a local file; works offline and on locked-down networks.
- **Small.** 34 KB of HTML including markup, styles and engine — sub-second load on any connection.
- **Standards-only stack.** Canvas rendering, Web Audio, localStorage: no framework lock-in.

GAPS THIS ONE-PAGER CANNOT FILL — FOUNDER INPUT REQUIRED

The data behind this document is the public repository and the live page. Neither contains a business case. Before this is shown to investors, the following must be supplied by the founder and must be true: the problem being solved and for whom; the business model and pricing; team and background; market sizing with sources; a competitive comparison against the many existing browser Tetris clones; any user, revenue or retention figures; roadmap and milestones; and the funding ask with use of proceeds. No such figures have been invented here.

RISKS VISIBLE IN THE CURRENT STATE

Third-party IP. Tetris is a registered trademark of The Tetris Company, which licenses the name, look and gameplay guidelines. This project is an unlicensed clone using the name 俄罗斯方块/Tetris; pitching it commercially without a licence is a legal exposure an investor’s counsel will find immediately. **No licence file** on the repository means default all-rights-reserved — unclear rights for users and contributors. **No description, homepage, topics, README badge or release** on the repository: there is no packaging around the product. **No distribution or metric instrumentation**: nothing measures users, sessions or retention, so no growth claim can currently be substantiated.

Sources & verification. All figures read 26 Oct 2026 from the GitHub REST API (repo metadata, root tree, languages, contributors, collaborators, commit history, Pages build, traffic endpoints) via the authenticated gh CLI, and from direct headless-browser inspection of the live page (title, DOM, scripts, resource timings). Point-in-time data that will drift — re-check before reuse. Prepared by Hermes Agent; no figure here is estimated, projected or rounded up.
